Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This sequence represents a primatized form of the antibody 16C10 light chain from macaque. This sequence is used in a method which studies new monoclonal antibodies (Mab 8) that bind selectively to 87.1 (CD80) or to 87.2 (CD86) antibodies and inhibite binding of these antigens to CD28. Such Mab's are specific immunosuppressants for treatment of diseases involving 7 cell/B cell interactions, particularly autoinmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type 1 diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel disease, allergy and multiple sclerois, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumnours. Optionally the Mab on be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. Mab s are optionally combined with other proteins or small molecule immunosuppressants. Blocking B7(CD28 interactions production of interleukin-2 (IL-2), T cell proliferation and entigen-specific immunosuppression, i.e. it inhibits antigen-specific immunosuppression and
New monoclonal antibodies specific for B7.1 or B7.2 antigens and inhibiting binding to CD28 - useful as specific immunosuppressants for treating diseases that involve interactions between T and B cells, e.g. graft rejection or tumours

```
The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7 cells. The invention is concer where B calls promote the growth and/or metastasis of tumours, cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leukaemia, and autcimmune diseases such as G cancer where B cells promote the growth and/or metastasis of tumours, CC type I diabetes mellitus, rheumatoria systemic lupus, erythematosus, type I diabetes mellitus, rheumatoria arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-vs-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistence to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative collitis, food-related allergies e.g. migraine, thinitis and eczema, and other types of allergies. The present protein continuis in the invention to induce apoptosis and inhibit production of interleukin-2 (IL-2).
  Use of monoclonal antibody which specifically binds to B7.1 antigen CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as

   2 Polypeptides (AAW01821 and AAW01822) respectively comprise primatised forms of the light and heavy chains of cynomolgus monkey anti-human heavy variable genes (see also AAT62512 and AAT62513) are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodm. of the primatised antibody in e.g. CHO cells. Primatised 7010 and 786 anti-B7.1 antibodies have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.

The present invention provides the coding and protein sequences for a number of human immune system associated proteins (HISAPP). These can be used in the diagnosis and treatment of various autoimmune disorders, infections and cell proliferation disease. The diseases include AIDS, adult respiratory distress syndrome, anaemia, asthma, atherosclerosis, cronn's adisease, irritable bowel syndrome, multiple sclerosis, myasthenia gravis, osteoarthritis, theumatoid arthritis, scleroderma, systemic lupus erythematosus, arteriosclerosis, cirrhosis and cancer.

The invention relates to isolate polymore to and and properties (I) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and pagene mapping, and in recombinant production of (II). The polymorlectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polymoptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical insorders involving aberrant protein expression or biological activity. The polymoptide and polymucleotide sequences have applications in disorders involving aberrant protein expression or biological activity. The polymoptide and polymucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human conducts data for this appear in the printed specification, but was obtained in electronic format directly from WIPO

   EBV-transformed cell lines and mouse-human heterohybridomas producing human MAbs specific for the gpl20 V3 loop of HIV-1 MN isolate were obtained. MAb 47-52D was found to recognise the tetrapeptide motif GPGR, i.e. the Principal Neutralising Determinant common to the V3 loop of different HIV isolates. A recombinant Ab was produced in which the L chain V region was derived from 447-52D and to which a signal sequence and a L chain intromic sequence are appended, fused to a fragment contg. a short intromic segment of the human lambda 2 crostant encoding domain.

   This sequence represents a primatized form of the antibody 7C10 light chair from macaque. This sequence is used in a method which studies new monclonal antibodies (Mab's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antibodes and inhibits binding of these antigens to CD28. Such Mab's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, I dismantory bowel disease, allergy and multiple sclerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the MAb'can be conjugated to a drug or toxin. MAb's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAb's are optionally combined with other proteins or small wolecule immunosuppressants. Blocking B7/CD28 interactions

useful for treating diseases such as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma. B cell lawtaemia, and autoimmune diseases such as indipopathic thrombocytopenia purpura, systemic lupus, erythematcsus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-ve-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive airways disease, intestinal inflammations and allergies e.g. Crohn's disease and ulcerative colitis, food-related allergies e.g. migraine, rhinitis and eczema, and other types of allergies. The present protein sequence represents the light chain of 7010, a primatised antibody used in the inventor to induce apoptosis and inhibit production of

   This represents a antibody HB4C5 light chain. This antibody light chain or its fragment is specific for carboxypeptidase from bovine or porcine pancreas and its reactive with human cancer tissue. The antibody light chain and its fragment can be used for preparation of a cancer radioimmunoimaging reagent and therapeutic compositions.

  The invention relates to isolated polymetrocide (i) and polypeptide (II) sequences. (I) be useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The color polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical insorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in disorders, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human condispondent or this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

This sequence encodes a primatized form of the antibody 7C10 light chain from macaque. This sequence is used in a method which studies new conditional antibodies (MAD's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such MAD's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, nost diseases, B cell lymphoma, infections (including by human immune celiciency virus) or inflammatory disease and tumours. Optionally the MAD can be conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins

  The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CDB0) and/or B7.2 antigen (CDB0) for inducting the apoptosis of B7+ cells. The invention is useful for treating diseases used as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of timours, B cell lymphoma, B cell lymptura, systemic lupus, erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-ve-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive airways disease, intestinal inflammations and allergies e.g. Crohn's disease and ulcerative colitis, food-related allergies e.g. migraine, rhinitis and eczema, and other types of allergies. The present nucleic acid sequence encodes the light chain of 7010, a primatised antibody used in the invention to induce apoptosis and inhibit production of

```

```
This cDNA encodes a antibody HB4C5 light chain. This antibody light chain or its fragment is specific for carboxypeptidase from bovine or porcine pancreas and is reactive with human cancer tissue. The antibody light chain and its fragment can be used for preparation of a cancer radioimmunoimaging reagent and therapeutic compositions.

BG685967 896 bp mRNA linear EST 01-MAY-2001 602638530F1 NIH_MGC_48 Homo sapiens cDNA clone IMAGE:4766335 5', mRNA sequence.
BG685967 GI:13917364
EST.
/note="Organ: pooled pancreas and spleen; Vector:
purv SpoRTG; Site_1: Not1; Site_2: EcoRV (destroyed); RNA
source anonymous pool of spleen and pancreas from 28 yo
male. Library is oligo-dT primed and directionally cloned
(ECORV site is destroyed upon cloning). Average insert
size 1.5 kb, insert size range 1-2.5 kb. Library is
normalized and enriched for full-length clones and was
constructed by C. Gruber (Invitrogen). Research Genetics
tracking code 2025. Note: this is a NIH_MGC Library."

This sequence encodes a primatized form of the antibody 16C10 light chain from macaque. This sequence is used in a method which studies new monoclonal antibodies (MAD 8) that bind selectively to BT.1 (CD80) or to BT.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such MaD's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoinmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythemators, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythemators, post inflammatory bowel disease, allergy and multiple selerosis, graft vs. host diseases. B cell lymphoma infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the MAD on be conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins or small molecule immunosuppressants. Blocking BT/CD28 interactions production of interleukin-2 (IL-2), T cell proliferation and inhibits production of interleukin-2 (IL-2), T cell proliferation and

Human, macaque monkey, light chain, primatised antibody, 16Cl0 antibody, neuroprotective, apoptosis inducer; allergy, CD28 receptor antagonist, PT 1 antigen, CD80, BT 2 antigen, CD86, B cell cancer, metastasis, tumour, B cell lymphoma, B cell leukaemia, autoimmune disease; graft-vs-host disease; immunosuppression; organ rejection;
  The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7.4 cells. The invention is useful for treating diseases such as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leukaemia, and autoimmune diseases such as idiopathic thrombocytopenia purpura, systemic lupus, erythematosus, type 1 diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allersy, multiple sclerosis or graft-ve-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or
   DNA sequence of a primatised form of the light chain of 16C10 antibody.

  2 DNA sequences (AAT62512 and AAT62513) respectively code for primatised forms (AAW01821 and AAW01822) of the light and heavy chain of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody 16C10. Cloned 16C10 light and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibodis have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders

   The present invention provides the coding and protein sequences for a number of human immune system associated proteins (HISAPs). These can be used in the diagnosis and treatment of various autoimmune disorders, infections and cell proliferation diseases. The diseases include AIDS, adult respiratory distress syndrome, anaemia, asthma, atherosolerosis, crohn's disease, irritable bowel syndrome, multiple sclerosis, myasthenia gravis, Osteoarthritis, theumatoid arthritis, scleroderma, systemic lupus
  New human immune system associated proteins (HISAP) and polynucleotides encoding the HISAP, useful for diagnosing, treating or preventing immune or cell proliferative disorders or infections

The invention provides a human monoclonal antibody (I) and its functional fragments specifically reactive with an F protein epitope of respiratory syncytial virus (RSV), and capable of neutralizing infection by the virus such as Glambda-1A or Glambda-1B. The antibody can be expressed by standard recombinant methodology. (I) is useful for detecting RSV by contacting a source suspected of containing RSV with (I) and determining whether (I) binds to the source. (I) is also useful for providing passive immunotherapy prophylactically, to RSV disease in a human. (I) is useful for therapeutic and/or prophylactic treatment of RSV infection in human patients, particularly infants and young children. (I) is also useful as a diagnostic reagent for the determination of RSV mediated disorders or for tracking progress of treatment of the disorders. The present Human monoclonal antibody and functional fragments, useful for therapeutic and/or prophylactic treatment of respiratory syncytial virus infection, is specifically reactive with the F protein epitope of the virus sequence represents the continuous DNA sequence of the coding region of Score 565.2; DB 22; Length 762; Pred. No. 1.4e-134;

   This is the DNA sequence of a polymucleotide that encodes the light chain variable region (see AAW88465) of the recombinant human monoclonal antibody (NAB) 4BS. 4BS recognises antibodies specific for GD2 antigen antibodies. Antibodies specific for GD2 recognise various cancers including glioblastoma, neuroblastoma, malignant and/or metastatic melanoma, breast adenocarcinoma, malignant and for metastatic melanoma, breast adenocarcinoma, malignant adenocarcinoma, small cell lung carcinoma, colon adenocarcinoma and prostate adenocarcinoma. The invention encompasses 4BS derivatives with immunologic specificity for antibodies specific for GD2. These derivatives, or antigen binding fragments, comprise regions of the 4BS VD junction and regions spanning the 4BS CDRs. Other derivatives include Fab, F(ab')2, Fab', scrv and isolated heavy and ight chains. Polymucleotide fragments (see AAX06951-54), both coding and complementary strands, encoding 4BS antibody V regions are also provided, as well as therapeutic plasmids and vectors, including vaccinia virus vectors, comprising these polymucleotides. He has been shown to mimic GD2, and is particularly useful in generating a host immune response to cancer. Products of the invention can be used in the detection and treatment of e.g.
New antibody 4B5 polynucleotides and polypeptides - used to develop products for the diagnosis and treatment of cancers and for prophylactic therapy to reduce risk of recurrence
                                       ACAGCTGCCAGGTCACGCATGAAGGGAGCACCGTGGAGAAGACAGTGGCCCCTACAGAAT

   BBV-transformed cell lines and mouse-human heterohybridomas producing human MAbs specific for the gp120 V3 loop of HIV-1 MN isolate were obtained. MAb 447-52D was found to recognise the tetrapeptide motif GPGR, i.e. the Principal Neutralising Determinant common to the V3 loop of different HIV isolates. A recombinant Ab was produced in which the L chain V region was derived from 447-52D and to which a signal sequence and a L chain intronic sequence are appended, fused to a fragment contg. a short intronic segment of the human lambda 2 C region and the human

polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The copynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating indicates involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in the produce of the traits to assess by biodiversity and to produce the produce or other traits to assess by biodiversity and to produce the trains to assess the polymeral produce or other traits to assess the produce or produce the produce or other traits to assess the produce or produce the produce or other traits to assess the produce or produce the produce or other traits to assess the produce or produce or produce or other traits to assess the produce or produce or produce or other traits to assess the produce or produce or produce or produce or produce or other traits to assess the produce or produce or produce or other traits to assess the produce or produce or produce or produce or produce or produce or produce or other traits to assess the produce or produce or produce or produce or produce or produce or produce or produce or produce or other traits to assess the produce or produce or produce or produce or produce or produce or produce or other traits the produce or produce or other traits the produce or produce or othe produce or other produce or produce or produce or other produc
   and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

  2 DNA sequences (AAT62509 and AAT62510) respectively code for primatised forms (AAW01817 and AAW01818) of the light and heavy chain of cynomolgus monkey anti-human B'.1 antigen monoclonal antibody 7C10. Cloned 7C10 light and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibody in e.g. CHO cells. Primatised 7B6 and 16C10 anti-Br.1 antibodies have also been produced (see also AAW01819-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders
  monoclonal antibody binding human B7.1 or B7.2 antigen for treating autoimmune disease or graft-versus-host disease
